

ABSTRACT

A wireless moving image and audio transmitting system is capable of enhancing a display quality of a moving image and an output quality of audio without expanding a bandwidth of radio communication . The wireless
5 moving image and audio transmitting system has a moving image and audio transmitter and a portable display terminal. When the portable display terminal is near the moving image and audio transmitter, the sound input from an audio input unit of the moving image and audio transmitter is directly output from an speaker of an audio output unit. At this time, the moving
10 image and audio transmitter transmits the input moving image at a low compression rate to the portable display terminal. Thus, the display quality of moving image and output quality of audio can be enhanced without expanding the bandwidth of radio communication.
